

# Intune Plus Consultancy Services

## For a secure migration to the cloud

If you're making the move to a Microsoft bundle with Intune, our Intune Plus Consultancy Services will ensure you maintain the right levels of security and operational efficiency.

With a wealth of knowledge and expertise across Android and iOS platforms, we can support all aspects of your Intune migration.

### Intune gap analysis

Appurity's consultants can run a detailed comparison of your current MDM solution versus Intune and other options to identify the benefits of each one and help you make informed decisions regarding your mobility strategy.

#### Our Gap Analysis will:

- Define your current business requirements for mobile and tablet devices
- Define your strategic mobile initiatives for 1-3 years
- Establish application requirements for business and consumer apps
- Confirm the Microsoft infrastructure and license type
- Determine other core applications required and connectivity
- Review your security posture (e.g. Mobile threat prevention)

### Integrated UEM solutions

Other products, including BlackBerry UEM and MobileIron, can now be integrated with Intune via the Microsoft Graph API.

#### Advantages of integrated UEM solutions include:

- The ability to leverage Intune App Protection policies from your UEM of choice
- Integration with Azure Compliance Policies.

### Microsoft and MobileIron

For organisations using Intune, Appurity recommends MobileIron to extend mobile device management (MDM) security through a mobile-centric zero trust approach.

 <p><b>All-in-one security</b></p> <p>MobileIron helps transform your device into your secure ID, enabling secure access to the enterprise. This is one of many security capabilities that Intune can't fully support.</p>	 <p><b>Eliminate passwords</b></p> <p>Zero sign-on automatically validates every user, device, app, network, and threat before greenlighting access—no password required. This saves time for mobile workers and IT teams.</p>	 <p><b>Technology integration</b></p> <p>You need to choose the right tools and solutions to increase security and productivity. MobileIron integrates with best-of-breed technology partners (Intune doesn't have this level of integration).</p>
---	---	---

### Microsoft and BlackBerry

Appurity provides BlackBerry solutions to secure and enable Microsoft environments, including the market-leading Unified Endpoint Management (UEM) solution.

BlackBerry is one of the first unified endpoint management platforms to add layered security for Microsoft Office 365 mobile apps, leveraging App Protection Policies available from Microsoft.

 <p>Comprehensive iOS and Android management</p>	 <p>Best-in-class mobile app management</p>	 <p>Data loss prevention for O365 and custom apps</p>	 <p>153 supported Knox policies</p>

## Appurity Mobile Managed Services

With a wealth of expertise, Appurity's consultants can help you develop a futureproof mobile strategy when you move to Intune. We will analyse your current services and help you identify what you want to achieve from a mobility and security perspective.

 Environment configuration	 Device management	 Device migrations
 Device deployment	 Advice on functionality	 Service enhancements

### Gold Build

We can help you build the right device with the right security parameters and the right level of compliance for your industry. We'll look at all your existing policies and profiles and then build your device with precise security settings while documenting every step. This is our Gold Build Standard.

### Intune bolt-on services

Whether you use Intune or another MDM system, we offer a range of agnostic solutions to improve the security and efficiency of your mobile environment.

 <p>Compared to Microsoft Windows 10 Always On VPN, Netmotion provides a great deal more. Features include reliable connectivity even when network connectivity is poor, and built-in Quality of Service to enable traffic shaping and ensure mission critical applications always have priority when communicating over the VPN.</p>	 <p>Lookout Mobile Endpoint Security is recommended by Microsoft. It provides visibility into phishing, app, network, and device-based risks. Organisations can use risk data to enforce conditional access on mobile devices. Lookout was the first to integrate Mobile Threat Defense with Microsoft Intune.</p>
 <p>By leveraging your existing infrastructure, Hypergate will give your employees access to company resources on their Android Enterprise and iOS smartphones. With Hypergate, accessing corporate data is faster and safer for your entire workforce.</p>	 <p>This productivity-focused solution allows iManage users to "Send and File" emails directly from the Nine email app when they are away from the office. It also lets mobile workers quickly file inbox items to the right matter.</p>

## Contact Appurity

Our consultants can help you to optimise your mobility strategy in a secure, efficient and cost-effective way.

## App security assesents

We know that many organisations lack the expertise and resources to monitor their applications adequately and adapt their security systems to mitigate emerging threats.

Following your App Security Assessment, our experts can then help you to develop a security strategy that will help you to protect your data, prevent attacks and meet compliance requirements within your industry.

### App security is essential

Application security is vital in terms of increasing operational efficiency, addressing compliance requirements, reducing risk, and improving trust between your business and customers.

### But how can you be sure any given app is 100% safe?

If your organisation doesn't fully understand the potential dangers of so-called "trusted" apps, then you are opening your business up to significant risk from a data perspective.

### Let's talk

We'd love to discuss how Appurity can increase app security and efficiency for your enterprise.
